Report ID: FLH-021-30052025

Comprehensive Soil Water Characteristics Analysis

This report provides a detailed analysis of soil water characteristics based on the Saxton & Rawls (2006) methodology. The analysis includes soil composition, water retention properties, and physical characteristics essential for agricultural and engineering applications.

Soil Properties

Basic Properties

Sand Content

40%

Clay Content

30%

Silt Content

30%

Organic Matter

2.5%

Professional Features

Texture Classification

Clay Loam

Bulk Density Factor

undefined g/cm³

Saturated Conductivity

25.5 mm/hr

Gravel Content

0%

Expert Parameters

Porosity

N/A%

Bulk Density

1.3 g/cm³

Particle Density

2.65 g/cm³

Void Ratio

N/A

Soil Texture Classification

The soil texture triangle is a fundamental tool in soil science that classifies soils based on their sand, silt, and clay content. This classification helps predict soil behavior, water retention, drainage characteristics, and agricultural suitability.

Soil Texture Triangle Chart
Sand: 40% | Clay: 30% | Silt: 30%
Classification: Clay Loam

Chart visualization would appear here in the interactive version

Texture Analysis

Primary Texture: Clay Loam
Dominant Particle: Sand
Texture Description: Fine texture with good water retention and moderate drainage

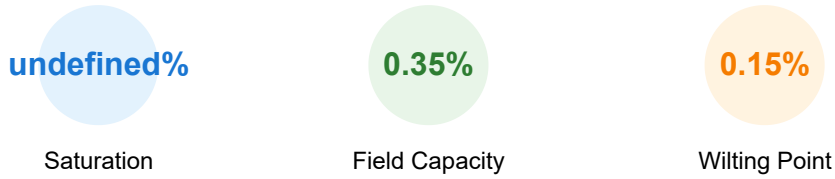
Water Content Distribution



Understanding Soil Water Characteristics

Field Capacity: The maximum amount of water soil can hold against gravity.

Wilting Point: The minimum water content at which plants can extract water.

Plant Available Water: The difference between field capacity and wilting point.

Saturation: The maximum water content when all pore spaces are filled.

Crop Recommendations

Clay Soils

Recommended crops: Rice, Wheat, Soybeans, Cotton

Excellent for crops requiring high water retention

Low Water Retention

Recommended crops: Drought-tolerant crops, Mediterranean herbs, Succulents

Consider drought-resistant varieties and irrigation
